

A small pilot. A stronger evidence base.

The proposed partnership

Jerry Bannister Zachary offers to develop and evaluate accessible AI tools with NCPWD leadership, persons with disabilities, experts and local intermediaries. Leadership selects the priority; the demonstration supports a conversation rather than assuming endorsement.

The problem and response

People can face fragmented information, inaccessible learning materials and slow follow-up. Impact Mosaic demonstrates one linked journey: fictional profile, recommendations, enrolment, lessons, assessment, practical feedback, demonstrated skills and mentoring. Intermediaries can assist at the learner's request.

Five opportunities to test

Accessibility: document explanations and support enquiries. Agriculture: reviewed training and extension questions. Employment: skills-based discovery and accommodation enquiries. NDMIS: authorised data-quality assistance. Zonal coordination: maintained human-support routing. Dependencies include dated sources, accessible resources and responsible staff.

Suggested 8-week pilot

Weeks 1-2: agree one use case, co-design with PWD participants, verify materials, accessibility and consent. Weeks 3-6: support 20 consenting learners through courses and expert follow-up. Weeks 7-8: analyse completion, support response and participant feedback. These are proposed parameters, not commitments or projected outcomes.

Evaluation

Record invitations, enrolments, active participation, lesson completion, quiz attempts and scores, practical assessment approval, mentoring requests, unresolved requests and time to first response. Report counts and denominators, dropouts and access barriers. Use baseline and endline practical tasks with a consistent expert rubric. Employment, income and longer-term wellbeing require separate later follow-up; learning gains alone do not establish causal economic impact.

Technical and access approach

React, TypeScript and Vite on Cloudflare Pages. A server-side Worker calls Groq with bounded non-identifying context and validates source IDs. A persistent global free-budget limiter caps AI requests. Courses and expert support work without AI. English, Hausa, Yoruba and Igbo support is experimental outside reviewed English originals. Text size, keyboard access, reduced motion, transcripts and suitable device read-aloud support access.

Data and accountability

Current records are fictional and isolated in the visitor's tab session, with reset and export. Real accounts or durable personal data require an authorised pilot, consent, role-based access, retention rules, safeguards and trained staff. NDMIS integration requires the system owner's authorisation, verified interfaces and an agreed schema. No identifying record is sent to the AI provider by the application.

Free-service constraints

No paid services are proposed. This demonstration reserves at most one AI call per minute and 20 per UTC day across the whole site. Free allowances can change and are not service guarantees. Missing credentials, quota or provider outages produce a clear error while learning stays usable.

Leadership decisions

Choose one pilot area and a responsible coordinator. Confirm participant recruitment, accessible delivery, expert capacity, language review and evaluation resources. Agree the governance and support arrangements before real participant records are introduced.
